

Improvement Plan

Issue	Details	Methods	Notes
Testing	Lack of testing section of code for the open source users.	While developing, we should test every possible scenario and functions.	We do tests for each function during the development, but we don't have the unit tests.
Deliverables	Not enough deliverables to the customers. Customers get the final product without receiving enough information and releases from us.	We should come up with the prototype / model and some basic features, then deliver our product to the customers to see their reaction and get feedback from them. With this approach, we can connect much deeper with the customers and know what specific function or feature they are looking forward to when using this kind of app.	
Patch	Do not have patch release information in our repository.	We should record the patch / version release of our product so that the development process is more visible to the public. Moreover, we're taking an open-source modelling approach, so it will make more sense if we have this information.	
Communication	Could do more communications with both the stakeholders and customers.	Try to make more posts or meetings with each major constituency.
